

Control Object Visibility

Many default and user-defined objects have an **Applications** tab to help you control the visibility of an object in the RiskVision applications. Even with sufficient permissions to access the application and the menu item, the object will not be visible to you if the applications is not selected as described below.

To control an object's visibility:

1. Select an object.
2. Click the **Applications** tab.
3. Click **Edit** and select the checkbox next to application(s).
4. Click **Save**. The object is now visible in the application(s) you have selected in the previous step.
