

About Threat and Vulnerability Manager

Threat and Vulnerability Manager allows organizations to consolidate their threat and vulnerability programs on a single platform. This application integrates with vulnerability, early warning, and exploit data feeds, such as those from iDefense, the National Vulnerability Database, and Offensive Security. It correlates these vulnerability data feeds with vulnerability scanner results to eliminate false positives and report incidents. Inferred scans are performed by correlating the vulnerability data feeds to a company's RiskVision entity database, mitigating risks for entities that aren't reachable by vulnerability scanners. Once detected, vulnerabilities are assessed and resolved using the system's workflow for true closed-loop vulnerability management.
