

Restore the RiskVision Server

To restore the server to a specific point in time, get a copy of the backup file made closest to the time you want to restore and then unzip the file in the base RiskVision Server installation directory (denoted by `%AGILIANCE_HOME%` in the installation instructions).

Use a WinZip-compatible tool (e.g., WinZip, WinRAR, etc.) to extract the contents of the RiskVision Server back up file; the Windows built-in tool for Compressed (zipped) Folders and the unzip command in Cygwin will not work (because the back up files are created with a Java zip package that can create zip files larger than 2 GB).
