

Reloading Application Configuration

Some customization requires the RiskVision solution to reload configuration and properties files. You can implement the changes without interrupting service (some changes will take effect when the server next starts).

Customization file	Description
<code>.properties</code>	Properties that control many aspects of the system
<code>TargetSelectionObjects.xml</code>	Customize the objects and fields that can be used to build the target selection criteria
<code>UICustomization.xml</code>	Customize the look and feel
<code>UIDictionary.xml</code>	Customize terms used in the user interface
<code>UIHelpTopics.xml</code>	Customize the 'About this Page' panels
<code>UIWorkspace.xml</code>	Customize the look and feel of individually-licensed applications
<code>Grids.xml</code>	Customize most grids

To implement customization:

1. Place the customized file in the correct location on the host computer. Your custom files are located in the folder:
`%AGILIANCE_HOME%\config\`
2. In the Administration application, go to **Administration > Server Administration > Commands**.
3. Expand the **Commands** tab and click the **Reload** button in the **Configuration** section.

When the process completes, the 'reloaded configuration' message displays.
