

Responding To Risk Register

The Risk Register user interface has been greatly improved to support the business logic by presenting multiple user interface views of a subcontrol mapped to a risk. Each view is interdependent and process-oriented and expects an action for useful reporting. After the risk assessment results are acquired, the controls that guard against risks must be evaluated based on the stakeholder's answer. In addition to the "assessment work on" permission and risk ownership, you need the "control author" permission for managing a control associated with a risk. To learn how to respond a risk, see [Navigating in Risk Management View](#) .
