

Mapping Incidents to Controls

Incidents can be mapped directly to the set of controls that would have prevented the incident.

To map an incident to a control:

1. Go to **Incidents > Incidents** and then select an incident to open its details page.
2. Click the **Controls** tab, then click **Map to Control**.
3. Select the control to map to the incident. Note that mapping is not transitive--that is, mapping an incident to a control does not automatically map it to the control's parent or children in the hierarchy.

To disassociate a control with an incident:

1. Go to **Incidents > Incidents** and then select an incident to open its details page.
2. Click the **Controls** tab, select the control and click **Unmap**.
