

Grid View Overview

The grid view displays a table of objects (users, programs, connectors, and so on) and their attributes. Each row in the table represents an object, and the columns reflect some of the object's attributes. In some cases, you can customize the columns and how they display particular attributes.

Sort the Table

To sort the table by any visible attribute, click that attribute's column heading. To reverse the sort (ascending order instead of descending), click the column heading again. To make a hidden attribute visible, see [Customizing the Columns](#).

Refresh

The table represents a snapshot of the underlying data at the time it was first displayed. Some data, such as Charts, are more dynamic, but all objects can change over time. To update the display with the latest data, click the **Refresh** button.
