

Enable Proxy Server

By setting up a proxy server, the connector will operate at a faster speed and save on bandwidth. This will cause the Exploit Database connector to run smoother and reduce the strain put on RiskVision as a whole.

To enable the proxy server:

1. Navigate to and open the `/Exploit Database Connector/cfg/connector.file.properties` file.
2. Ensure the following properties are displayed as follows:

```
Proxy.useProxyServer = true
Proxy.serverHost = Server Hostname
Proxy.serverPort = 3128
Proxy.httpType = http
```

3. Save the file.
4. Restart the Exploit Database connector.
